# White Paper

Involta Coin is issued by the Involta Foundation as a funding tool for initiatives and developments, critical for social advancement, technology, government control processes, business processes, internal interaction in any organized structures and between such structures. The main principle of Involta Coin is the evolutionism of technologies and processes and the possibility of their further endless growth by the forces of human society. This document reflects the most critical positions and values of Involta Coin, formulated as a result of many years of observing the progress of blockchain as a powerful independent technology, potentially supportive for a large number of crucial social processes, stimulating their transformation.

# Involta Coin mission

The current blockchain toolbox is limited. At the beginning of 2021, the technology's potential is unleashed and shown only in the context of financial instruments. It took only ten years to change humanity's understanding of the cross-border economy forever.

Meanwhile, the structure of blockchain can aim to a large number of systematic problems. In the future 30 years, we see the possibility of a fundamental transformation of approaches to solving a massive number of government and business processes. Like crypto finance, which aims to erase financial boundaries between states, the general potential of technology is to erase boundaries in many more critical issues.

Investors' attention is drawn to financial instruments with a local perspective, often limited to one or two years, but not those instruments with the potential to transform current processes in the longer term. Thus, the task of the upper level of technology evolution is to draw attention to little-studied areas with high potential in the long-term planning horizon.

Involta Coin's mission is to help unlock the potential of the world's most promising technology and spread the resulting new tools to the outsider spheres of our time. The exponentially growing speed of sector-specific human development makes it necessary to stimulate the periphery artificially.

# Involta Coin goals

The funds raised during the implementation of Involta Coin will be used to organize work in two main fundamental directions.

## 1. Public awareness campaign

Despite the growing number of stakeholders, you still face a lack of awareness of the technology, its possible extension paths, possible uses, and benefits.

Groundwork for the emergence of new blockchain ideas and tools are new minds with sufficient extensive knowledge in the field. Only keen insight into the technology will make it possible to realize the range of its application areas.

One can take responsibility for creating one tool, but its actual effectiveness and applicability will not be proven until it is designed, tested, and implemented in the working structure. Ideas generation cannot be concentrated in the hands of one person or an organized group of people because the probability of their eventual success will remain low until there made a sufficient number of attempts.

The upper-level task is to generate knowledgeable people able to make attempts, generate ideas, and create. This is the only powerful method that is most likely to provide evolutionary approaches to solving various problems in the future.

This can be achieved through the funding of catalysts.

## Open crypto university creation funding

The information field of people significantly determines the vector of social progress. The consumer society has formed and continues to strengthen in the related information field.

The blockchain expert community exists, but it does not spread the accumulated knowledge extensively. The task of the crypto university is to transfer the accumulated knowledge, thus forming an information field that will shift the vector of its participants' thought process towards technological evolution.

Blockchain professions already exist but in the form of self-established and industry-specific ones. The vast majority of blockchain engineers did not have specialized knowledge at the start.

Now you can see the necessity for an organized system that will allow technology to develop.

## Funding blockchain evangelists support

Financial support for blockchain evangelists is a process accompanying the formation of a concerned community. The upcoming task of evangelists is to spread the truthful overview of the technological world and show its significant potential. The quantitative outcome can be achieved through the efforts of numerous evangelists. Promotion of the latest technology development path is an incentive to gain knowledge in promising blockchain industries and the only way to create a new generation of blockchain engineers and other industry professionals.

Modern specialists will create the newest tools and approaches to the development of blockchain technologies.

## 2. Scientific activity

Наряду Along with the funding of public awareness campaign, it is essential to support existing scientific initiatives in the blockchain. Existing promising scientific works and developments often require direct financial support. Their financing can influence the course of evolution of many existing nonoptimal processes and structures.

As a result of funding scientific activities, it will be possible to conduct research and organize experimental development of those crypto-initiatives that have gone unnoticed until now, often due to their economic inefficiency - impossibility of profit-making from the results obtained in the course of research and/or development. However, it is crucial to understand that based on the results of such research and development, there can subsequently be founded new initiatives necessary for the transformation of approaches, processes, and technologies. Returning to the likelihood of revolutionary instruments appearing, the lack of funding for such non-profit research initiatives is one of the constraints to the emergence of such instruments.

Implementing a transparent grant system for initiators of scientific activities and ensuring this system open and accessible is one of the two global challenges facing the Involta Foundation. The current state of the economy and society stimulates research and creation with a view to the future profit. Many vital areas are overlooked due to global commercialization. The evolution of non-commercial areas of life and society can only be achieved by decommercializing the minds of the initiators. Funding will enable them to systematically work through any of their own scientific hypotheses, not just those with commercial potential.

# The value of Involta Coin for investors

The funds raised will be reinvested in the popularization and development of the blockchain industry, including its financial sector. This will increase investor attention and ensure the flow of new investment capitals into the cryptocurrency market.

Involta Coin is of strategic importance for those involved in the crypto-financial market as investors and those who see its development and growth potential.

Involta Coin provides interested investors with access to a strategic instrument and the ability to influence the development and evolution of the global technological branch.

# Legal information

According to the Involta Coin issue rules:

1) is not a direct or indirect analog of securities of any kind, shares in companies, obligations, rights of claim or property, does not entitle its owners to any promises of payments, dividends, unconditional income, profit, or investment income;

2) does not grant the holder any rights concerning the Involta Foundation, including the right to receive dividends, income, interest or ownership, intellectual property rights, voting, distribution, liquidation rights, and any other financial, legal, or equivalent rights;

3) is not a classic financial instrument, so it does not represent money or e-money, stocks, bonds, securities;

4) is not a product;

5) non-refundable.
